Moderation is a way to check whether that third variable influences the strength or direction of the relationship between an independent and dependent variable. An easy way to remember this is that the moderator variable might change the strength of a relationship from strong to moderate, to nothing at all. It is almost like a turn dial on the relationship; as you change values of the moderator, a statistical relationship that you observed before might dissolve away.

What is the difference between moderation and mediation ...

Mediation. Mediation is looking for a channel through which X influences Y. For example, supposed that for women, class environment (X) predicts course interest (Y) through perceptions of belonging (M). Statistically, mediation attempts to show two things. First, that the pathway connection X → M → Y is altogether significant.

Mediation and moderation can co-occur in statistical models. It is possible to mediate moderation and moderate mediation. Moderated mediation is when the effect of the treatment A on the mediator and/or the partial effect B on the dependent variable depend in turn on levels of another variable (moderator). Essentially, in moderated mediation, mediation is first established, and then one investigates if the mediation effect that describes the relationship between the independent variable and ...

In statistical moderation, the moderating variable affects (i.e., controls) the relationship between the IV and the DV. In that sense, a foreperson of a jury who moderates the discussion of 12 people deciding the fate of an accused person may be said to be similar to a moderating variable in a multiple regression.
