objects are not "aware" of themselves. Object-oriented programming languages all give this self-awareness to objects, which allows methods to reuse others, and to be (mutually) recursive. Consider a simple extension of our counters from the previous chapter with an inc-by!

The Interpretation of Object-Oriented Programming ...

The focus of procedural programming is to break down a programming task into a collection of variables, data structures, and subroutines, whereas in object-oriented programming it is to break down a programming task into objects that expose behavior (methods) and data (members or attributes) using interfaces. The most important distinction is that while procedural programming uses procedures to operate on data structures, object-oriented programming bundles the two together, so an "object ...
