Amateur radio RF power amplifiers. These pages contains various information about several RF power amplifiers, mainly for the HF bands, that I have built and characterized. Most of the measurement were done with the automated system described in the automated IMD measurements page, so a standard set of data is usually shown: Power output (fundamental and first harmonics) vs. single-tone input ...

In the RF signal chain, the power amplifier (PA) is the active element located between the transmitter signal chain circuitry and the antenna, Figure 1. It is often a single discrete component, one with requirements and parameters which differ from those of much of the transmit chain as well as the receiver circuitry.

Following the RF fil- ter, the limiting circuit keeps the power sup- ply above 250 V, to allow the tubes to oper- ate in class-AB at low power. It also limits the maximum voltage, to protect the amplifier if the main ac supply goes high. Without it, the instantaneous input power can reach 3 kW, meaning danger to tubes and capacitors.
